

Amendment to Specification:

Please replace the paragraph on page 9 of the specification, second complete paragraph lines 7-11, with the following replacement paragraph showing the change made by this amendment:

-- Although both polymeric film layers which form the containment of the device of the invention can be transparent, it is not necessary that the film layer upon which the fabric layer is fixed be transparent as well. The advantages associated with ~~[second]~~ side transparency of the invention can be fully appreciated from the presence of the second side transparency alone.--

Please replace the paragraph on page 10 of the specification, second complete paragraph, lines 8 -14, with the following replacement paragraph showing the change made by this amendment:

-- The infant heel warming device of the invention can be manufactured using conventional equipment and techniques readily available to those skilled in the art. For example, the containment can be constructed as a thermal sealed bag structure, or two sheets with perimeters sealed. Generally, the heel warmer device of ~~[then]~~ the invention can be assembled by heat sealing layers of the flexible polymeric film, one laminated on the outer surface with a non-woven material, around a predetermined liquid fill volume content. A securing strap can then be manually applied onto the device.--
